

1. The Solar System

The solar system is what's up there out and about in space, all around the planet we live on! That's right! Our sun, the star that warms and lights up the Earth! And not forgetting all the planets that move around it, our moon, and so forth. There are eight planets (yeah, we are in the third group of them from the sun!). Some of the planets are made of rock, and others are made of gases. How do astronauts find out about all there is to know out there? They use telescopes and satellites, of course. Some intelligent scientists even blast rockets to the planets and moons! Of course, the moon orbits around the Earth and even helps the ocean with its tides. Finding out about the solar system teaches us about the universe and how the planets orbit day after day!

2. The Human Body

The human body is made of a lot of neat systems that work every day! The skeletal system gives support to our bodies, and protects important organs in us in case we should fall or fall against something. Then, we have muscles that help us to move more things and, in most cases, allow us to carry things too! Who knew that our

blood throughout our body is moved around just by a special system, the circulatory system? Our heart pumps blood all about the body to all the nooks and crannies with oxygen. Using the lungs of the respiratory system, we help ourselves take in the air we need. The food we eat is aided by the digestive system, which allows us to break it down for nourishment and energy. To keep us from getting sick, doctors and nurses study our bodies and all their workings. And it is only some of the repairs and stuff the human body is supposed to do to stay healthy and moving that I have just scratched the surface of! Another would be drinking plenty of water, and of course, taking a nice leisurely walk daily!

3. Plants and Photosynthesis

Here's a bit about the plants! Yes, they are living organisms, and need direct sunlight, water, air, and nutrients to survive! Most of them are neat and even make their own food in a nifty process called photosynthesis. In fact, they use the sunlight, and carbon dioxide and water that they take in, to do a process and produce glucose and oxygen! Chlorophyll, the green substance in leaves, enables plants to absorb sunlight. Roots draw earth and moisture from the soil for use in the plant. Stems convey the water and nutrients to different parts of the plant. Flowers are organs that help a plant to bear seed. Plants are of great

importance to animal life. All the air we breathe is made by them, as well as nearly all the food of most of our race; on the other hand, without them, we animals could not live or possibly even exist.

4. The Importance of Geometry

Geometry is a part of mathematics that has to do with certain figures, lines, angles, and space. We learned in geometry class that there are triangles, circles, and rectangles, and other classes of figures. A triangle, we learned, is a figure with three sides and three angles. A rectangle is a figure with four sides, but with opposite sides equal. Geometry is used by builders, engineers, and artists. Architects use it in building designs and engineers use it in bridges and other work. We learned to find the perimeter and the area. The volume was found by using a formula. A ruler and a protractor help us to measure lines and angles. Doing all this kind of work helped us to learn to think clearly and to think logically. Geometry assists individuals in comprehending patterns, dimensions, and how objects are positioned relative to one another.

5. Learning Percentages

Percentages are applicable for comparing any two numbers in terms of 100. The symbol for percent is the percent sign (or %). Students apply percentages in their

lessons in mathematics relative to problems about discounts and prices; it is also used in relation to grades and data; that is, 90 percent shows that there are 90 right answers out of the one hundred. Stores often employ percent-off during the same periods so they can reduce prices for items that otherwise would sell at a loss. Percent can be expressed sometimes as a fraction or a decimal; to express a percent numerically, students use their multiplication and division tables for each permutation of numbers. Also, graphs and tables are used to express information in terms of percent; we use percent to deal with statistics about money, voting, and costs, and so on; it helps us with school problems.

6. Vocabulary of Measurement

Everywhere in mathematics and science is the subject of measurement. We all measure length and height, distances, and the weights of things. The ordinary words used for measurement include meter and meter stick in mathematics, mile and yard, and Greek foot to the inch in science. The ruler measures the short things, while the measuring tape takes in the longer ones. Children love measurement, so besides solving their word problems with tape and yardsticks, athletes take the

7. Learning Good Study Habits

Good study habits help students succeed in school and improve academic performance. Students should create a study schedule to manage time wisely and complete assignments on time. A quiet environment helps students focus during reading and writing activities. Taking notes during lessons also improves understanding and memory. Some students review vocabulary words and practice grammar exercises every night. Others ask teachers questions when they do not understand a lesson. Rest and proper sleep are important because tired students may lose concentration in class. Reading books regularly can improve comprehension and communication skills. Developing good study habits helps students become responsible, organized, and confident learners in different subjects.

8. Preparing for a School Program

Students in Grade Seven prepared for the school program with excitement and teamwork. Some students practiced singing for the choir presentation, while others rehearsed dances and short plays. The teachers guided students during practice and reminded them to speak clearly on stage. One group worked on decorations using colorful paper and art materials. Another group prepared invitations for parents and guests. During the

final rehearsal, students felt nervous but continued practicing confidently. On the day of the program, everyone wore clean uniforms and performed well. The audience applauded loudly after each performance. The school program became successful because students cooperated and showed responsibility throughout the preparation activities.

9. The School Library

The school library is a quiet place where students can read and study. Shelves are filled with books about science, mathematics, history, and literature. Students visit the library to borrow books, complete assignments, and improve reading skills. The librarian helps students find information and choose interesting stories to read. Some students prefer adventure books, while others enjoy poetry and biographies. Reading regularly helps students learn new vocabulary and improve comprehension. The library also has dictionaries, newspapers, and reference materials for research projects. Many students enjoy spending time in the library because it provides knowledge, peace, and opportunities to discover new ideas and information.

10. A Helpful Friend

Maria is a kind and helpful student in Grade Seven. Every morning, she arrives at school early and greets her classmates with a smile. During English class, she helps other students understand difficult words and sentences. One day, her friend forgot to bring a notebook for the lesson. Maria shared her extra notebook without hesitation. After class, the teacher praised Maria for her good attitude and responsibility. Her classmates admired her because she was respectful and caring. Maria believes that helping others can make school a happier place. Because of her kindness, many students enjoy being her friend and working with her during activities.

11. Patterns and Algebra

Algebra is a branch of mathematics that uses symbols and letters to represent numbers. Students learn to solve equations and identify patterns in algebra class. A variable is a letter that stands for an unknown number. Equations contain equal signs that show two sides have the same value. Patterns help students predict what comes next in a sequence. For example, adding two to each number creates a simple pattern. Algebra is useful in business, science, and technology. Engineers and scientists use algebra to solve problems and make calculations. Understanding algebra helps students

develop critical thinking and improve their mathematical reasoning skills every day.

12. States of Matter

Matter is anything that has mass and takes up space. The three common states of matter are solid, liquid, and gas. Solids have a fixed shape and volume. Liquids have a fixed volume but can change shape depending on the container. Gases spread out and do not have a fixed shape or volume. Heat can change the state of matter. Ice melts into water when heated. Water turns into vapor during evaporation. Scientists study matter to understand physical and chemical changes. Matter is found everywhere, including rocks, air, water, plants, and animals. Understanding matter helps people learn more about science and daily life.
